ISBN (13): 978-1-5275-8884-4

Dedicated to my sister Nabanita who left us on September 27, 2021.

Jaydip

TABLE OF CONTENTS

List of Figures.....	viii
List of Tables.....	xvi
About the Author.....	xxi
Preface.....	xxii
Chapter 1	1
A Robust and Accurate Predictive Framework for the Indian Mid Cap Sector Index	
Chapter 2	45
A Deep Learning Model for Sectoral Profitability Study of the Indian Stock Market	
Chapter 3	94
Sectoral Volatility Analysis of the Indian Stock Market using GARCH	
Chapter 4	168
Portfolio Design using Mean-Variance Optimization and Hierarchical Risk Parity Approach	
Chapter 5	225
A Comparative Study of Performance Metrics in Mean-Variance Portfolio Optimization	
Chapter 6	295
A Cointegration-Based Approach to Pair Trading of Stocks from Selected Sectors of the Indian Stock Market	
Index.....	371

LIST OF FIGURES

Fig. 1-1. Time series of the mid-cap sector in the BSE of India.....	11
Fig. 1-2. Decomposition of the BSE mid-cap time series.....	12
Fig. 1-3. The actual and the predicted index using Method I	20
Fig. 1-4. The ACF plot of residuals of model of Method I.....	21
Fig. 1-5. Actual and predicted index using Method II.....	23
Fig. 1-6. The ACF plot of residuals of model of Method II	23
Fig. 1-7. Actual and predicted index using Method III.....	26
Fig. 1-8. First-order difference time series of mid-cap sector	29
Fig. 1-9. ACF plot of stationary series of mid-cap sector.....	29
Fig. 1-10. PACF plot of stationary series of mid-cap sector.....	30
Fig. 1-11. ACF plot of residuals of the ARIMA model.....	30
Fig. 1-12. Actual & predicted index using Method IV	32
Fig. 1-13. Actual & predicted index using Method V	34
Fig. 1-14. ACF plot of residuals of model of Method V	35
Fig. 2-1. Architecture of LSTM model.....	51
Fig. 2-2. Loss convergence of LSTM model for Maruti Suzuki	53
Fig. 2-3. Actual vs predicted price of Maruti Suzuki stock	54
Fig. 2-4. Loss convergence of LSTM model for the HDFC Bank.....	55
Fig. 2-5. Actual vs predicted price of HDFC Bank stock.....	55
Fig. 2-6. Loss convergence of LSTM model for Titan Company.....	57
Fig. 2-7. Actual vs predicted price of Titan Company	57
Fig. 2-8. Loss convergence of LSTM model for ITC.....	58
Fig. 2-9. Actual vs predicted price of ITC.....	59
Fig. 2-10. Loss convergence of LSTM model for Sun Pharma	60
Fig. 2-11. Actual vs LSTM predicted price of Sun Pharma	60
Fig. 2-12. Loss convergence of LSTM model for Infosys.....	62
Fig. 2-13. Actual vs LSTM predicted price of Infosys	62
Fig. 2-14. Loss convergence of LSTM model for Zee Entertainment.....	63
Fig. 2-15. Actual vs predicted price of Zee Entertainment.....	64
Fig. 2-16. Loss convergence of LSTM model for Tata Steel	65
Fig. 2-17. Actual vs LSTM predicted price for Tata Steel	65
Fig. 2-18. Loss convergence of LSTM model for Reliance Industries.....	67
Fig. 2-19. Actual vs predicted price of Reliance Industries.....	67
Fig. 2-20. Loss convergence of LSTM model for DLF	68
Fig. 2-21. Actual vs LSTM model-predicted price of DLF	69

Fig. 2-22. Loss convergence of LSTM for Larsen & Toubro.....	70
Fig. 2-23. Actual vs LSTM model-predicted price of DLF	70
Fig. 2-24. Loss convergence of LSTM model for Power Grid Corp	72
Fig. 2-25. Actual vs predicted price of Power Grid Corp	72
Fig. 2-26. Loss convergence of LSTM model for ICICI Bank.....	74
Fig. 2-27. Actual vs predicted price of ICICI Bank.....	74
Fig. 2-28. Loss convergence of LSTM model for State Bank of India.....	75
Fig. 2-29. Actual vs predicted price of State Bank of India.....	76
Fig. 3-1. Daily log return plots of MSZ stock	104
Fig. 3-2. Daily volatility plots of MSZ stock.....	105
Fig. 3-3. Stand resids and cond vol of const mean GARCH for MSZ....	108
Fig. 3-4. Actual vs GARCH-predicted return for MSZ	109
Fig. 3-5. Residuals of GARCH model for MSZ	110
Fig. 3-6. Actual vs GARCH-fitted volatility for MSZ stock	113
Fig. 3-7. EGARCH forecasts of daily returns for MSZ	113
Fig. 3-8. Daily log return plots of HDB stock	116
Fig. 3-9. Daily volatility plots of HDB stock	118
Fig. 3-10. Stand resids and cond vol of const mean GARCH for HDB .	120
Fig. 3-11. Actual vs GARCH-predicted return for HDB.....	121
Fig. 3-12. Residuals of GARCH model for HDB.....	122
Fig. 3-13. Actual vs GARCH-fitted volatility for HDB stock	124
Fig. 3-14. EGARCH forecasts of daily returns for HDB.....	125
Fig. 3-15. Daily log return plots of TTC stock	127
Fig. 3-16. Daily volatility plots of TTC stock	129
Fig. 3-17. Stand resids and cond vol of const mean GARCH for TTC ..	131
Fig. 3-18. Actual vs GARCH-predicted return for TTC.....	132
Fig. 3-19. Residuals of GARCH model for TTC.....	133
Fig. 3-20. Actual vs GARCH-fitted volatility for TTC	135
Fig. 3-21. EGARCH forecasts of daily returns for TTC.....	136
Fig. 3-22. Daily log return plots of TCS stock	138
Fig. 3-23. Daily volatility plots of TCS stock.....	139
Fig. 3-24. Stand resids and cond vol of const mean GARCH for TCS...	142
Fig. 3-25. Actual vs GARCH-predicted return for TCS.....	143
Fig. 3-26. Residuals of GARCH model for TCS.....	144
Fig. 3-27. Actual vs GARCH-fitted volatility for TCS	146
Fig. 3-28. EGARCH forecasts of daily returns for TCS.....	147
Fig. 3-29. Daily log return plots of SPI stock.....	150
Fig. 3-30. Daily volatility plots of SPI stock	151
Fig. 3-31. Stand resids and cond vol of const mean GARCH for SPI	153
Fig. 3-32. Actual vs GARCH-predicted return for SPI	153
Fig. 3-33. Residuals of GARCH model for SPI	155

Fig. 3-34. Actual vs GARCH-fitted volatility for SPI	157
Fig. 3-35. EGARCH forecasts of daily returns for SPI	158
Fig. 4-1. Dendrogram of auto sector stocks.....	175
Fig. 4-2. Weight allocation by MVP & HRP for auto sector stocks.....	175
Fig. 4-3. Returns of MVP & HRP for auto sector stocks on trng data....	176
Fig. 4-4. Returns of MVP & HRP to auto sector on test data.....	177
Fig. 4-5. Dendrogram of banking sector stocks.....	178
Fig. 4-6. Weight allocation by MVP & HRP to banking sector stocks ..	178
Fig. 4-7. Returns of MVP & HRP for banking sec stocks on trng data..	179
Fig. 4-8. Returns of MVP & HRP to banking sector on test data.....	180
Fig. 4-9. Dendrogram of cons durab sector stocks	181
Fig. 4-10. Weight alloc by MVP & HRP to cons durab sector stocks....	181
Fig. 4-11. Returns of MVP & HRP to cons durab stocks on trng data ...	182
Fig. 4-12. Returns of MVP & HRP to cons durab stocks on test data....	183
Fig. 4-13. Dendrogram of FMCG sector stocks	184
Fig. 4-14. Weight allocation by MVP & HRP to FMCG sector stocks	184
Fig. 4-15. Ret of MVP & HRP to FMCG stocks on trng data	185
Fig. 4-16. Ret of MVP & HRP to FMCG sector stocks test data	186
Fig. 4-17. Dendrogram of IT sector stocks.....	187
Fig. 4-18. Weight allocation by MVP & HRP for IT sector stocks.....	187
Fig. 4-19. Returns of MVP & HRP for IT sector stocks on trng data.....	188
Fig. 4-20. Returns of MVP & HRP for IT sector stocks on test data.....	189
Fig. 4-21. Dendrogram of pharma sector stocks.....	190
Fig. 4-22. Weight allocation by MVP & HRP to pharma sector stocks ...	190
Fig. 4-23. Ret of MVP & HRP for pharma sec stocks on trng data.....	191
Fig. 4-24. Ret of MVP & HRP for pharma sec stocks on test data	192
Fig. 4-25. Dendrogram of realty sector stocks.....	193
Fig. 4-26. Weight allocation by MVP & HRP to realty sector stocks	193
Fig. 4-27. Return of MVP & HRP for realty sector stocks on trng data....	194
Fig. 4-28. Return of MVP & HRP for realty sector stocks on test data..	195
Fig. 4-29. Dendrogram of metal sector stocks.....	196
Fig. 4-30. Weight allocation by MVP & HRP to metal sector stocks	196
Fig. 4-31. Return of MVP & HRP for metal sector stocks on trng data ...	197
Fig. 4-32. Return of MVP & HRP for metal sector stocks on test data..	198
Fig. 4-33. Dendrogram of oil & gas sector stocks	199
Fig. 4-34. Weight allocation by MVP & HRP to oil & gas sector.....	199
Fig. 4-35. Return of MVP & HRP for oil & gas sector on trng data	200
Fig. 4-36. Return of MVP & HRP for oil & gas sector on test data	201
Fig. 4-37. Dendrogram of media sector stocks.....	202
Fig. 4-38. Weight allocation by MVP & HRP to media sector stocks....	202
Fig. 4-39. Return of MVP & HRP for media sector on trng data	203

Fig. 4-40. Return of MVP & HRP for media sector on test data	204
Fig. 4-41. Dendrogram of private banks sector stocks	205
Fig. 4-42. Weight allocation by MVP & HRP to pvt sec banks stocks ..	205
Fig. 4-43. Return of MVP & HRP for pvt sec bank stocks on trng data...	206
Fig. 4-44. Return of MVP & HRP for pvt sec bank stocks on test data .	207
Fig. 4-45. Dendrogram of PSU banks sector stocks	208
Fig. 4-46. Weight allocation by MVP & HRP to PSU banks sector.....	208
Fig. 4-47. Return of MVP & HRP for PSU banks on trng data.....	209
Fig. 4-48. Return of MVP & HRP for PSU banks on test data.....	210
Fig. 4-49. Dendrogram of financial services sector.....	211
Fig. 4-50. Weight allocation by MVP & HRP to fin serv sector	211
Fig. 4-51. Return of MVP & HRP for fin serv sector on trng data.....	212
Fig. 4-52. Return of MVP & HRP for fin serv sector on test data.....	213
Fig. 4-53. Dendrogram of NIFTY 50 stocks	214
Fig. 4-54. Weight allocation by MVP & HRP to NIFTY 50 stocks	214
Fig. 4-55. Return of MVP & HRP for NIFTY 50 on trng data.....	216
Fig. 4-56. Return of MVP & HRP for NIFTY 50 on test data.....	216
Fig. 5-1. Portfolio of auto sector with max Sharpe ratio	232
Fig. 5-2. Portfolio of auto sector with max Sortino ratio.....	233
Fig. 5-3. Portfolio of auto sector with max Calmar ratio.....	234
Fig. 5-4. Portfolio compositions for auto sector stocks	234
Fig. 5-5. Cumulative returns of auto sector portfolios on training data..	235
Fig. 5-6. Cumulative returns of auto sector portfolios on test data.....	236
Fig. 5-7. Portfolio of banking sector with max Sharpe ratio.....	237
Fig. 5-8. Portfolio of banking sector with max Sortino ratio.....	238
Fig. 5-9. Portfolio of banking sector with max Calmar ratio.....	238
Fig. 5-10. Portfolio compositions for banking sector stocks	239
Fig. 5-11. Cumulative returns of banking sec portfolios on trng data	240
Fig. 5-12. Cumulative returns of banking sec portfolios on test data.	240
Fig. 5-13. Portfolio of cons durb sector with max Sharpe ratio	241
Fig. 5-14. Portfolio of cons durb sector with max Sortino ratio	242
Fig. 5-15. Portfolio of cons durb sector with max Calmar ratio	243
Fig. 5-16. Portfolio compositions for cons durb sector	243
Fig. 5-17. Cumulative returns of cons durb sec portfolios on trng data..	244
Fig. 5-18. Cumulative returns of cons durb sec portfolios on test data ..	245
Fig. 5-19. Portfolio of FMCG sector with max Sharpe ratio	246
Fig. 5-20. Portfolio of FMCG sector with max Sortino ratio	247
Fig. 5-21. Portfolio of FMCG sector with max Calmar ratio	247
Fig. 5-22. Portfolio compositions for FMCG sector.....	248
Fig. 5-23. Cumulative returns of FMCG sector on trng data.....	249
Fig. 5-24. Cumulative returns of FMCG sector on test data.....	249

Fig. 5-25. Portfolio of IT sector with max Sharpe ratio.....	251
Fig. 5-26. Portfolio of IT sector with max Sortino ratio.....	251
Fig. 5-27. Portfolio of IT sector with max Calmar ratio.....	252
Fig. 5-28. Portfolio compositions for IT sector.....	252
Fig. 5-29. Cumulative returns of IT sec portfolios on trng data.....	253
Fig. 5-30. Cumulative returns of IT sec portfolios on test data.....	254
Fig. 5-31. Portfolio of pharma sector with max Sharpe ratio.....	255
Fig. 5-32. Portfolio of pharma sector with max Sortino ratio.....	256
Fig. 5-33. Portfolio of pharma sector with max Calmar ratio.....	256
Fig. 5-34. Portfolio compositions for pharma sector.....	257
Fig. 5-35. Cumulative returns of pharma sec portfolios on trng data.....	258
Fig. 5-36. Cumulative returns of pharma sec portfolios on test data.....	258
Fig. 5-37. Portfolio of realty sector with max Sharpe ratio.....	259
Fig. 5-38. Portfolio of realty sector with max Sortino ratio.....	260
Fig. 5-39. Portfolio of realty sector with max Calmar ratio.....	261

Fig. 5-54. Cumulative returns of oil & gas sec on test data.....	271
Fig. 5-55. Portfolios of media sector with max Sharpe ratio.....	272
Fig. 5-56. Portfolio of media sector with max Sortino ratio.....	273
Fig. 5-57. Portfolio of media sector with max Calmar ratio.....	273
Fig. 5-58. Portfolio compositions for media sector.....	274
Fig. 5-59. Cumulative returns of media sec on trng data.....	275
Fig. 5-60. Cumulative returns of media sec on test data.....	275
Fig. 5-61. Portfolio of pvt banks sec with max Sharpe ratio.....	277
Fig. 5-62. Portfolio of pvt banks sec with max Sortino ratio.....	277
Fig. 5-63. Portfolio of pvt banks sec with max Calmar ratio.....	278
Fig. 5-64. Portfolio compositions for pvt banks sector.....	278
Fig. 5-65. Cumulative returns for pvt banks sec on trng data.....	279

Fig. 5-66. Cumulative returns for pvt banks sec on test data.....	280
Fig. 5-67. Portfolio of PSU banks sec with max Sharpe ratio	281
Fig. 5-68. Portfolio of PSU banks sec with max Sortino ratio.....	281
Fig. 5-69. Portfolio of PSU banks sec with max Calmar ratio.....	282
Fig. 5-70. Portfolio compositions for PSU banks sector	283
Fig. 5-71. Cumulative returns for PSU banks sec on trng data.....	284
Fig. 5-72. Cumulative returns for PSU banks sec on test data.....	284
Fig. 6-1. The matrix of the cointegration tests for auto sector.....	302
Fig. 6-2. Daily close prices of BF and AL stocks.....	303
Fig. 6-3. OLS regression model for AL and BF close prices.....	303
Fig. 6-4. Residual plot of the AL-BF OLS regression model.....	304
Fig. 6-5. Z-values of the ratio series of BF-AL pair	305
Fig. 6-6. The pair-trading signals for BF and AL.....	305
Fig. 6-7. Daily value of BF-AL pair portfolio over test period	306
Fig. 6-8. The matrix of the cointegration tests for banking sector.....	308
Fig. 6-9. Daily close prices of SB and IF stocks.....	308
Fig. 6-10. OLS regression model for IF and SB close prices	309
Fig. 6-11. Residual plot of the SB-IF OLS regression model.....	309
Fig. 6-12. Z-values of the ratio series of SB-IF pair.....	309
Fig. 6-13. The pair-trading signals for SB and IF.....	310
Fig. 6-14. Daily value of SB-IF pair portfolio over test period	310
Fig. 6-15. The matrix of the cointegration tests for cons durb sector	312
Fig. 6-16. Daily close prices of VL and CG stocks	312
Fig. 6-17. OLS regression model for CG and VL close prices.....	313
Fig. 6-18. Residual plot of the VL-CG OLS regression model	313
Fig. 6-19. Z-values of the ratio series of VL-CG pair	314
Fig. 6-20. The pair-trading signals for VL and CG	314
Fig. 6-21. Daily value of VL-CG pair portfolio over test period.....	315
Fig. 6-22. The matrix of the cointegration tests for FMCG sector	316
Fig. 6-23. Daily close prices of CP and HU stocks	317
Fig. 6-24. OLS regression model for CP and HU close prices	317
Fig. 6-25. Residual plot of the HU-CP OLS regression model.....	318
Fig. 6-26. Z-values of the ratio series of HU-CP pair.....	318
Fig. 6-27. The pair-trading signals for HU and CP.....	319
Fig. 6-28. Daily value of HU-CP pair portfolio over test period	319
Fig. 6-29. The matrix of the cointegration tests for IT sector stocks.....	321
Fig. 6-30. Daily close prices of TC and CF stocks	322
Fig. 6-31. OLS regression model for CF and TC close prices.....	322
Fig. 6-32. Residual plot of the TC-CF OLS regression model	323
Fig. 6-33. Z-values of the ratio series of TC-CF pair	323
Fig. 6-34. The pair-trading signals for TC and CF	324

Fig. 6-35. Daily value of TC-CF pair portfolio over test period.....	324
Fig. 6-36. The matrix of the cointegration tests for pharma sector.....	326
Fig. 6-37. Daily close prices of LP and AK stocks.....	327
Fig. 6-38. OLS regression model for AK and LP close prices	327
Fig. 6-39. Residual plot of the LP-AK OLS regression model.....	328
Fig. 6-40. Z-values of the ratio series of LP-AK pair.....	328
Fig. 6-41. The pair-trading signals for LP and AK.....	329
Fig. 6-42. Daily value of LP-AK pair portfolio over test period	329
Fig. 6-43. The matrix of the cointegration tests for realty sector.....	331
Fig. 6-44. Daily close prices of OR and PE stocks.....	332
Fig. 6-45. OLS regression model for PE and OR close prices.....	332
Fig. 6-46. Residual plot of the OR-PE OLS regression model.....	333
Fig. 6-47. Z-values of the ratio series of OR-PE pair	333
Fig. 6-48. The pair-trading signals for OR and PE.....	334
Fig. 6-49. Daily value of OR-PE pair portfolio over test period	334
Fig. 6-50. The matrix of the cointegration tests for metal sector.....	335
Fig. 6-51. Daily close prices of HI and JS stocks	336
Fig. 6-52. OLS regression model for JS and HI close prices.....	337
Fig. 6-53. Residual plot of the HI-JS OLS regression model	337
Fig. 6-54. Z-values of the ratio series of HI-JS pair	338
Fig. 6-55. The pair-trading signals for HI and JS	339
Fig. 6-56. Daily value of HI-JS pair portfolio over test period.....	339
Fig. 6-57. The matrix of the cointegration tests for oil & gas.....	341
Fig. 6-58. Daily close prices of GA and IG stocks	341
Fig. 6-59. OLS regression model for IG and GA close prices.....	342
Fig. 6-60. Residual plot of the GA-IG OLS regression model	342
Fig. 6-61. Z-values of the ratio series of GA-IG pair	343
Fig. 6-62. The pair-trading signals for GA and IG	343
Fig. 6-63. Daily value of GA-IG pair portfolio over test period.....	344
Fig. 6-64. The matrix of the cointegration tests for media sec	345
Fig. 6-65. Daily close prices of ZE and DT stocks.....	346
Fig. 6-66. OLS regression model for DT and ZE close prices.....	346
Fig. 6-67. Residual plot of the ZE-DT OLS regression model.....	347
Fig. 6-68. Z-values of the ratio series of ZE-DT pair	347
Fig. 6-69. The pair-trading signals for ZE and DT	348
Fig. 6-70. Daily value of ZE-DT pair portfolio over test period	348
Fig. 6-71. The matrix of the cointegration tests for pvt bank sec	350
Fig. 6-72. Daily close prices of IN and IF stocks	351
Fig. 6-73. OLS regression model for IF and IN close prices.....	351
Fig. 6-74. Residual plot of the IN-IF OLS regression model	352
Fig. 6-75. Z-values of the ratio series of IN-IF pair.....	353

Fig. 6-76. The pair-trading signals for IN and IF 353

ABOUT THE AUTHOR

Jaydip Sen has experience in research, teaching, and industry over a span of 27 years. He had worked in reputed organizations like Oil and Natural Gas Corporation Ltd, India, Oracle India Pvt Ltd, Akamai Technology Pvt Ltd, Tata Consultancy Services Ltd and National Institute of Science and Technology, India, and Calcutta Business School, India. Currently, he is associated with Praxis Business School, Kolkata, INDIA, as a professor in the department of Data Science and Artificial Intelligence. His research areas include security in wired and wireless networks, intrusion detection systems, secure routing protocols in wireless ad hoc and sensor networks, trust, and reputation-based systems, privacy issues in ubiquitous and pervasive communication and the Internet of Things, machine learning, deep learning, and artificial intelligence in the financial domain. He has more than 200 publications in reputed international journals and referred conference proceedings and 20 book chapters in books published by internationally renowned publishing houses like Springer, CRC press, IGI-Global, etc. He has also authored two books which are published by two internationally reputed publishing houses. He has been listed among the top 2% of scientists in the world for the last three consecutive years 2019-2021, as per studies conducted by Stanford University, USA. Prof. Sen serves on the editorial board of three prestigious international journals and on the technical program committee in several international conferences of repute. Prof. Sen is a senior member of IEEE and ACM, USA.

PREFACE

The subject of financial time series analysis has attracted substantial attention in the last two decades, especially after Professors Robert Engle and Clive Granger won the Nobel awards. At the same time, this field has undergone rapid evolution and developments, especially in high-frequency finance, stochastic volatility, and the availability of sophisticated software and tools. While at a basic level, financial time series analysis is concerned with the theory and practice of asset valuation over time, at a broader level it includes diverse topics such as analysis of high-frequency price observations, arbitrage pricing theory, asset price dynamics, optimal asset allocation, cointegration, capital asset price models, and value at risk. It is a highly empirical discipline, but like other scientific fields theory forms the foundation for making inferences.

There is, however, a key feature that distinguishes financial time series analysis from other time series analyses. Both financial theory and its empirical time series contain an element of uncertainty. For example, there are various definitions of asset volatility, and for a stock return series, the volatility is not directly observable. As a result of the added uncertainty, statistical and econometric theories, and methods play an important role in financial time series analysis.

The chapters in the volume present several techniques of financial time series analysis and forecasting based on statistical and econometric approaches. The historical stock prices and sectoral index values for important stocks and sectors listed on the National Stock Exchange (NSE) of India and the Bombay Stock Exchange (BSE) are used in building financial models which are used to predict the future values of the index and stock prices. The statistical and econometric methods discussed in the chapters of this book include exponential smoothing, Holt and Winter trend and seasonality method, time series decomposition, autoregressive integrated moving average (ARIMA) method, ordinary least square regression (OLS), generalized autoregressive conditional heteroscedasticity (GARCH), and cointegration.

Chapter 1 titled *A Robust and Accurate Predictive Framework for the Indian Mid-Cap Sector Index* presents a time series decomposition-based approach for analyzing the salient characteristics of the time series of the mid-cap sector of the Indian economy from January 2010 to December

2021. The time series of the mid-cap sector index is decomposed into its three components - trend, seasonal, and random. Based on the decomposition results several interesting characteristics of the time series are identified. The month of March is found to exhibit the highest level of seasonality for the mid-cap time series, while July experiences the lowest seasonality effect. The time series is found to consist of a very moderate random component with the mean value of the percentage of the random component to the time series' aggregate value being as low as 4.73. The time series was found to be dominated by its trend component. Further, five predictive models are proposed for forecasting the future index values of the time series. Using the five models and based on the training data of the mid-cap sector's monthly index values from January 2010 to December 2021, the monthly index values for the year 2021 are forecasted. The models are compared based on their forecast accuracies.

Chapter 2 titled *A Deep Learning Model for Sectoral Profitability Study of the Indian Stock Market* presents an LSTM model for predicting future stock prices. The model is optimized with suitably designed layers and regularized using the dropout regularization method. The historical stock prices for 140 stocks from fourteen sectors listed in NSE, India are extracted from the web from January 1, 2010, to July 13, 2022. The model is used for predicting future stock prices with a forecast horizon of one day and based on the predicted output of the model, buy/sell decisions of the stocks are taken. The total profit earned from the buy/sell transactions for a stock is normalized by its mean price over the entire period to arrive at the profitability measure of the stock. The profitability figures of all stocks of a sector are summed up to derive the overall profitability index of the sector. It is observed that while the *fast-moving consumer goods* (FMCG) sector is the most profitable one, the *realty* sector has the lowest profitability index. The accuracy of the LSTM model is measured using three metrics, Huber loss, *mean absolute error* (MAE), and the *accuracy score*. It is observed that the LSTM model is highly accurate.

Chapter 3 titled *Sectoral Volatility Analysis of the Indian Stock Market using GARCH*, illustrates the design and analysis of several volatility models based on different variants of GARCH have been presented. The models are built on the historical stock prices from five important sectors listed on the NSE of India from January 1, 2010, to April 30, 2022. From each of the five sectors, the top ten stocks are selected based on the report published by the NSE on December 31, 2021. The five sectors are auto, banking, consumer durables, information technology, and pharma. The GARCH models are fine-tuned and then backtested on the out-of-sample data to estimate their accuracies in the prediction of future volatility of the

stocks. While it is observed that asymmetric GARCH models outperform their symmetric counterparts, EGARCH is found to have yielded the most accurate results for all the stocks analyzed in this work.

Chapter 4 titled *Portfolio Design using Mean-Variance Optimization and Hierarchical Risk Parity Approach* presents portfolio design approaches for stocks chosen from thirteen sectors and NIFTY 50 stocks on the National Stock Exchange of India. Based on the historical prices of the ten stocks with the largest free-float market capitalization from each sector and the 50 stocks in the NIFTY group, the *mean-variance portfolio* (MVP) and the *hierarchical risk parity* (HRP) portfolios are designed. The portfolios are backtested on both training and the test data to identify the portfolio with the higher cumulative return and higher Sharpe Ratio for each sector. It is found that while on the training data, the MVP portfolio yielded the higher cumulative returns for seven among the fourteen sectors, the return yielded by the HRP portfolio is found to be higher for eleven sectors on the test data. Since for a portfolio, its performance on the test data is what matters to the investors, the results of the study indicate that the HRP portfolio is a better choice over the MVP for the investors of the Indian stock market.

Chapter 5 titled *A Comparative Study of Performance Metrics in Mean-Variance Portfolio Optimization* illustrates three different approaches to portfolio design based on the maximization of three ratios – the *Sharpe ratio*, the *Sortino ratio*, and the *Calmar ratio*. Twelve important sectors listed on the National Stock Exchange of India are first selected, and portfolios are designed based on the three approaches for ten stocks from each sector on the historical stock prices from January 1, 2017, to December 31, 2020. The performances of the portfolios are evaluated based on their cumulative returns for the period January 1, 2021, to December 31, 2021. It is observed that, for the test period, the cumulative returns of portfolios built on the maximization of the Sharpe ratio are the highest for eight sectors of the twelve sectors studied in the work. The results demonstrate the superiority of the *Sharpe ratio* as the metric in portfolio optimization.

Chapter 6 titled *A Cointegration-Based Approach to Pair Trading of Stocks from Selected Sectors of the Indian Stock Market* presents a cointegration-based pair-trading approach that identifies stock pairs that exhibit robust cointegration in their prices over three years from January 1, 2018, to December 31, 2020. The stocks are chosen from twelve sectors listed on the National Stock Exchange of India. Once the cointegrated pairs are identified, the pair-trading portfolios are formed and the performance of the portfolios is observed over a test period of one year from January 1, 2021, to December 31, 2021. Suitable trigger points are identified so that the short and the long positions for both stocks are identified accurately. The

reality and the PSU bank sectors are found to have produced the best results as all the cointegrated pairs from these two sectors yielded positive returns. However, four pairs from the auto sector out of a total of ten pairs yielded negative returns.

While the chapters in this volume do not cover the basic theories of the topics involved, all the relevant principles and fundamentals are discussed in brief in the chapters for the sake of completeness. Hence, even if some background knowledge of statistics and econometrics may be useful, the readers are not expected to have advanced knowledge in those fields. I am sure that the volume will be a valuable resource to anybody interested in gaining knowledge in financial time series analysis. However, the primary target reader groups for the book are the advanced postgraduate and doctoral students of finance, econometrics, management, data science, computer science, and information technology. Further, faculty members of graduate schools and universities, and practitioners in the industry working in the areas of financial analytics, risk management, security analysis, and portfolio management, are also expected to find the book quite useful.

I express our sincere thanks to all without whose help and support this project would not have been a success. Special thanks are due to Adam Rummens, Commissioning Editor, Amanda Miller, Typesetting Manager, and Courtney Dixon, Designer of Cambridge Scholars Publishing for their support and cooperation. The members of my family have always been the sources of motivation and inspiration for all my scholastic and academic works of mine. I dedicate my work to my beloved sister Ms. Nabanita Sen, who, unfortunately, left us on 27th September 2021, due to the deadly disease of cancer. My sister was always the pillar of strength for me, and she was the primary source of support and motivation for my effort toward this volume. Last but not the least, I gratefully acknowledge the immense support and motivation I received from my wife Ms. Nalanda Sen, my daughter Ms. Ritabrata Sen, and my mother Ms. Krishna Sen. Without their sacrifice and support, the publication of this volume would not have been possible. Many thanks to all of them!

Jaydip Sen

CHAPTER 1

A ROBUST AND ACCURATE PREDICTIVE FRAMEWORK FOR THE INDIAN MID-CAP SECTOR INDEX

Introduction

Developing an accurate and efficient forecasting framework for the robust prediction of stock prices has been one of the most exciting yet complex challenges researchers face in machine learning and analytics. Researchers have proposed numerous technical, fundamental, and statistical indicators for accurately predicting the prices of stocks. Sen and Datta Chaudhuri proposed a novel approach based on time series decomposition and analysis for efficient portfolio diversification and prediction of stock prices (Sen, 2022; Sen, 2018b; Sen, 2018c; Sen, 2017a; Sen, 2017b; Sen & Datta Chaudhuri, 2018; Sen & Datta Chaudhuri, 2017a; Sen & Datta Chaudhuri, 2017b; Sen & Datta Chaudhuri, 2017c; Sen & Datta Chaudhuri, 2016a; Sen & Datta Chaudhuri, 2016b; Sen & Datta Chaudhuri, 2016c; Sen & Datta Chaudhuri, 2016d; Sen & Datta Chaudhuri, 2016e). The authors hypothesized that all sectors of an economy do not exhibit a similar pattern of variations in their stock prices. It is more usual to find that various sectors exhibit different patterns in their trend, different characteristics in their seasonality behavior, and varying degrees of randomness in their time series values. While on the one side, the efficient market hypothesis has argued for the randomness aspect of stock price movements. On the other side, there are propositions to counter the hypothesis by delving into various fundamental characteristics of different sectors and different stocks in those sectors. We argue that in addition to the differences in the fundamental attributes among stocks belonging to multiple companies, the performances of different stocks are also very much dependent on and coupled to the sectors to which the stocks belong. Since the behavior of each sector of the economy is influenced by its unique set of factors, the pattern of the price movement of stocks belonging to various sectors is also determined and influenced by these factors.

In this chapter, our goal is to study the behavioral pattern exhibited by the time series of the *mid-cap* sector of India so that the salient properties of that sector can be better understood. By its definition, a *mid-cap* company has a market capitalization between Indian Rupees (INR) 50 billion to INR 200 billion. For our study, the monthly average index values of the *mid-cap* sector are used for the period January 2010 - December 2016 as per the Bombay Stock Exchange (BSE). The monthly time series data is decomposed into its three components using functions defined in the R programming language. Based on the decomposition results, we demonstrate how several exciting characteristics of the time series can be extracted to gain valuable insights into its behavioral pattern. We particularly illustrate how a more in-depth analysis of the trend, seasonal and random components, provides us with helpful information about the growth pattern, seasonal properties, and randomness exhibited by the time series index values. For predicting future behavioral patterns, we also propose an extensive framework for time series forecasting consisting of five methods of prediction of time series index values. The five forecasting methods are critically analyzed in terms of forecasting accuracy.

The organization of the chapter is as follows. The section titled *Related Work* presents a brief literature survey on some of the current work on time series analysis and forecasting. In the section titled *Methodology*, we present a detailed description of the methodology we followed in this work. We discuss in detail the method of decomposition of the *mid-cap* sector time series into its various components. The section titled *Time Series Decomposition Results* presents extensive decomposition results of the time series values into its trend, seasonal and random components. The decomposition results are analyzed in-depth to understand several essential characteristics and behavior revealed by the time series. In the section titled *Proposed Forecasting Methods*, we propose a set of five forecasting methods for predicting the future values of the time series. In the section titled *Forecasting Results*, we provide results on the performance of five forecasting methods on the *mid-cap* sector time series data. Each of the proposed algorithms is evaluated and compared based on two performance metrics. The first metric is based on the computation of the *root mean square error* (RMSE). However, to express the RMSE as the percentage of the mean value of the target variable, we design a derived metric that is computed as the ratio of the RMSE to the mean values of the target variable. The second metric used for comparing the performance of the predictive model is *mean absolute percentage error* (MAPE). Finally, in the section titled *Conclusion*, we conclude the chapter and highlight some future directions of work.

Related Work

In the literature, researchers have proposed several approaches and techniques for forecasting the daily prices of stocks and index values of various sectors of the economy. Neural network-based approaches are the most popular among these propositions.

Mostafa presented a method of forecasting the movement of stock prices in Kuwait that utilized the concepts of *artificial neural networks* (ANNs) (Mostafa, 2010). The author used historical stock price records from the Kuwait Stock Exchange (KSE) from 2001 to 2003 and builds two models, (i) a multi-layer perceptron (MLP) and (ii) a generalized regression neural network, for predicting the close price of the stocks listed in KSE. The results show that the generalized regression neural network is more accurate in forecasting future stock prices.

Kimoto et al. proposed neural network models based on historical accounting data and various macroeconomic factors. The neural network models were found to be accurate in predicting the movement patterns in several stock returns (Kimoto et al., 1990).

Leigh et al. illustrated various approaches to predicting stock prices and stock market index movements in the New York Stock Exchange (NYSE) from January 1981 to December 1999 (Leigh et al., 2005). The authors used linear regression and simple neural network models in developing their proposed approaches.

Hammad et al. demonstrated how the output of an ANN model can be forced to converge after executing a finite number of iterations and then producing highly accurate predicted values of stock prices (Hammad et al., 2007).

Dutta et al. designed predictive models using ANNs for forecasting the closing index values of the BSE from January 2002 to December 2003 (Dutta et al., 2006).

Tsai and Wang carried out a study investigating how and why the forecasting accuracy produced by a BN-based approach usually is higher than that yielded by a traditional regression and neural network-based method (Tsai & Wang, 2009).

Tseng et al. showed how techniques like traditional time series decomposition, HoltWinters models, Box-Jenkins method, and artificial neural networks can be applied in predicting the prices of a randomly selected set of 50 stocks from September 1998 to December 2010 (Tseng et al., 2012). The authors observed that the forecasting errors were minor for the Box-Jenkins method, HoltWinters model, and normalized neural

network model. However, higher error values were observed in the time series decomposition method and non-normalized neural network model.

Moshiri and Cameron proposed a *backpropagation network* (BPN) with econometric models for predicting the inflation level of the economy using the following techniques: (i) Box-Jenkins Autoregressive Integrated Moving Average (BJARIMA) model, (ii) Vector Autoregressive (VAR) model, and (ii) Bayesian Vector Autoregressive (BVAR) model (Moshiri & Cameron, 2010).

Thenmozhi demonstrated how the chaos theory can be applied to identifying the pattern of changes in stock prices in the Bombay Stock Exchange (BSE) from August 1980 to September 1997. The author discovered that the daily and weekly returns of the BSE index exhibited non-linear trends, while the BSE index showed a weakly chaotic movement pattern (Thenmozhi, 2006).

Hutchinson proposed a novel approach based on the principle of learning networks for accurately predicting the price of a derivative (Hutchinson et al., 1994).

Mehtab and Sen presented a series of work on the design of predictive models for the future stock price and index values and movements based on innovative machine learning and deep learning architectures (Sen, 2021; Sen, 2018a; Sen & Mehtab, 2022; Mehtab & Sen, 2022; Mehtab & Sen, 2021; Mehtab & Sen, 2020a; Mehtab & Sen, 2020b; Mehtab & Sen, 2020c; Mehtab & Sen, 2019; Mehtab et al., 2021; Mehtab et al., 2020). The models proposed by the authors used historical stock prices and stock index values at daily intervals or 5 minutes intervals. The power of *convolutional neural networks* (CNNs) and *long- and short-term memory* (LSTM) networks was exploited for achieving a very high level of accuracy in the out-of-sample of data. The authors proposed four CNN models and six LSTM models that differ in architecture and input data (i.e., univariate or multivariate time series data and the size of the input data). The models were compared on their *root mean square error* (RMSE) values. The results elicited two interesting observations: (i) the performances of the CNN models are superior to that of the LSTM models, and (ii) the models based on the univariate data yield more accurate forecasting. In another set of papers, Sen et al. proposed further variants of CNN and LSTM-based models for predicting future stock price values and stock price movements for designing optimum portfolios of stocks (Sen & Datta Chaudhuri, 2018; Sen et al., 2021a; Sen et al., 2021b; Sen et al., 2021c; Sen & Mehtab, 2021d; Sen et al., 2021e; Sen et al., 2021f; Sen & Mehtab, 2021g; Sen et al., 2020). The authors reported extensive results for comparing the performance of the models.
